❗ Sometimes a location running auto End Of Day will be missing a journal or may have not reported or printed reports it was supposed to.

The following are some steps you can take to troubleshoot and verify that auto EOD is setup and being used correctly.

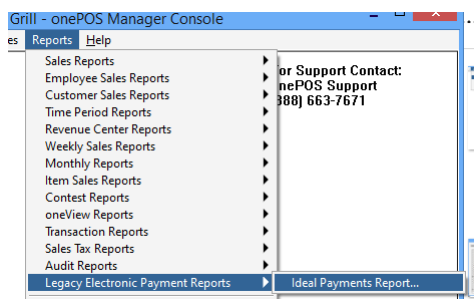

Preliminary Checking Journals

You can verify if a date has sales data and had EOD ran correctly by checking either the journals folder in **C:\OnePOS\JOURNALS** and sorting by date modified.

OR you can go to manager console **Reports > Sales Reports > Daily Sales Report** for the selected date and see if the report has data.

Blank report = EOD not ran , no reports can be printed / emailed.

You can also check **Reports > Legacy Electronic Payment Reports > Ideal Payments Report**

Within this report, you can check the **Date / Time** column to ensure the sales listed are for the correct day. If there are multiple days on one report, it could mean journals have combined and need to be split.

1. Keep MC Open

- Ensure that Manager Console **REMAINS OPEN** on the terminal set up to run auto EOD (typically T1)

⚠ If MC is not open in the background, auto EOD will NOT RUN

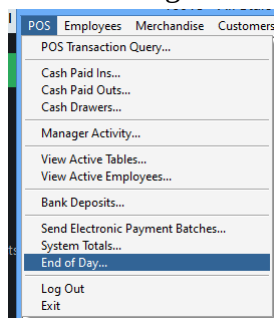

Once Manager Console is open, it will not close until someone physically clicks / taps the X to close it. Only reason it may close is if a terminal is rebooted or has internet connection issues.

It does not have to be logged in to a user, just open.

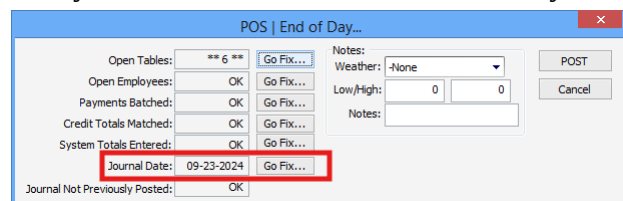

If a terminal is labeled as Auto-EOD, make sure MC stays open at all times on that terminal.

2. Check EOD Date

In the Manager Console, navigate to **POS > End Of Day**

Verify that the Journal Date is set correctly:

Whatever date this is set to, auto EOD will run at the set time for this date.

Ex: Set as 9/23/24. EOD will run at 3AM On 9/23/24 and create journal file for 9/23.

Be sure this date is set correctly especially if you keep getting 'auto EOD will run in x minutes' warning. Ensure that the box below does not say ****DUP**** either.

3. Check for Stand-In Payments

⚠ On older versions of OnePOS, stand-in payments will stop auto-EOD from running. If the version is after 24.2.0, the following steps are less relevant.

Sometimes you will get a warning when trying to batch that says "Stand in Payment on EMV Reader #XX". If you navigate to the manager menu on a terminal and select 'stand in payments' in the top right corner, you can view stand-in payments here.

❗ The terminal # will coincide with the # at the end of the stand in payment error message (ex: Stand in Payment on EMV Reader #03, check Term 3)

There are a multitude of different reasons stand-ins can occur. It is often due to unstable internet connection.

💡 What is most relevant here is if there are stand in payments with **no yellow error message**, they will go away within a few minutes. Simply backing out of the stand-in payments menu and going back in can make the payments disappear, meaning they have cleared.

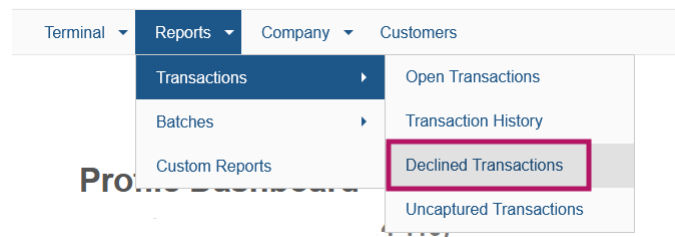

Possible Stand-Ins:

TTID Not Found - [TTID Not Found](#)

- Try the fixes mentioned in this KB article.

NOTE: the 15-30 minute window mentioned for the payments to clear begins when we FIRST go into the stand-in payments menu , it does not begin from when they re-establish internet connection.

DECLINED - The payment has declined, meaning the card number was entered correctly but the transaction was unable to clear, more than likely due to lack of balance in account. Declined transactions can also be located and viewed in detail within TranSafe under the customer's active profile dashboard under **transactions > declined transactions**

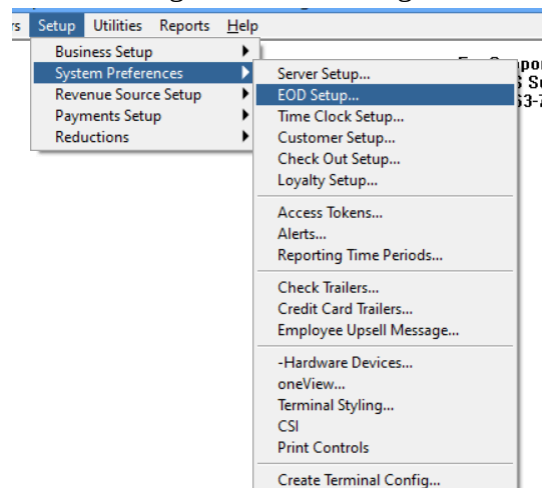

- A risk of taking payments offline / in stand-in mode is that you won't know if a card declines until internet connection is re-established.

💡 Once you have verified there are no stand in payments on the terminal(s) that was mentioned in the error message, you can click '**batch anyway**' on the error.

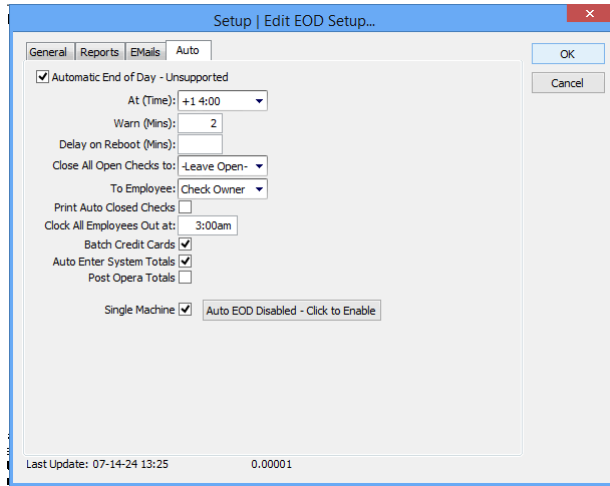

If they have no yellow message and are *still* not clearing, consult the following article: [Stand-In Payments Not Clearing](#)

4. Verify Auto EOD Settings

In the Manager Console, navigate to **setup > system preferences > EOD Setup**

- Navigate to the **Auto** Tab and verify settings are correct for how the location wants.

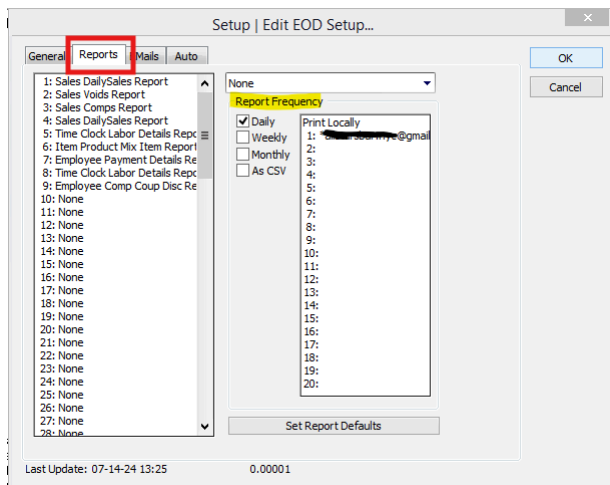

Check this article for info on this menu: [Auto EOD - Automatic End of Day Setup and Information](#)

💡 Most importantly, ensure that the top box is checked for automatic end of day.

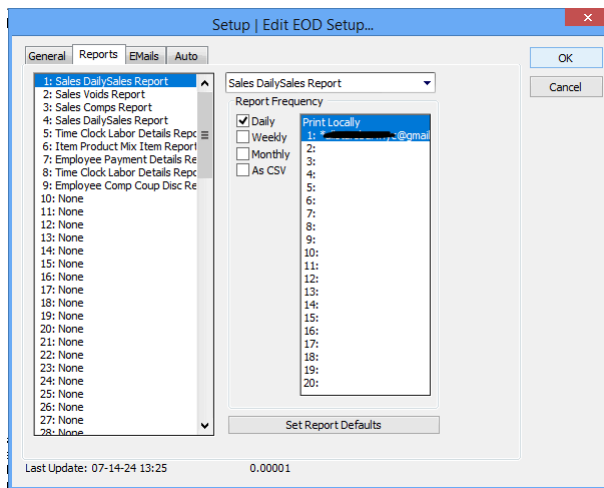

Also check that the box at the bottom does not say 'auto EOD Disabled - click to enable.'

- Check the **Emails** tab to ensure the correct email is input. You can add a new email from here as well.
- Check the **Reports** tab to ensure correct reports are being emailed / printed at correct frequencies.

Print Locally sends the report to whatever printer is set as local printer in windows settings

The selected options will be highlighted blue, and the drop box allows selection of the report type. For example, this shows the daily sales report is being printed and emailed to that address daily.

An asterisk in front of the email ensures that one email that includes all reports together are sent , instead of sending them in separate emails

5. Check Default Printer Settings

- If a report is not printing, check windows settings under device settings.

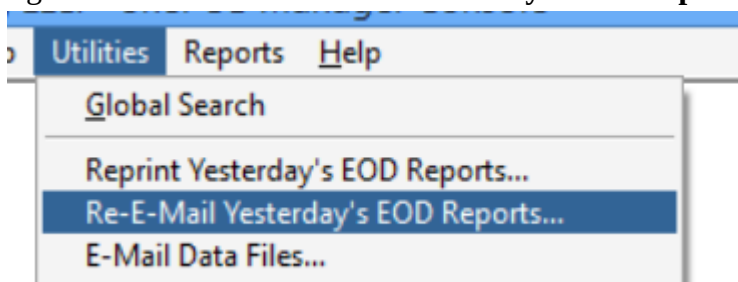

This will vary per version of windows, but generally, it will be in device settings under scanners and printers. Within scanners and printers menu, if the printer is detected, it will have a label of '**default**' next to it.

onePOS Support is limited in what it can do to when it comes to office printers. Meaning they can check that is connected, but not do any troubleshooting with the physical device as office printers are 3rd party equipment not sold by onePOS.

If you are not seeing the device as connected, try power cycling the printer, re-seating (unplugging and plugging back in) or replacing cables, or checking device settings inside the printer itself.

If You Still Need to Print / Email a Report

- go to **Utilities > Re- E-Mail Yesterdays EOD Reports** or **Utilities > Re-Print Yesterdays EOD Reports**

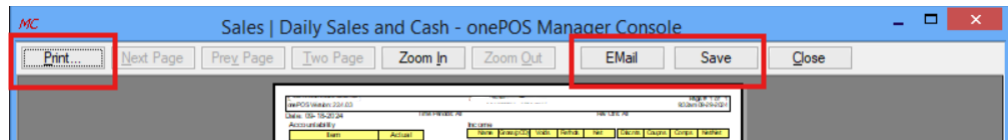

OR

- Navigate to Manager Console to **Reports** tab and select the report you want.
Select date range and other parameters, then click preview

In new window that appears, select the **Print**, **Email**, or **Save** option

Save option saves a copy of the report PDF to the local system drive.

If the Email and Save option do not appear, this would be due to being on an older version of the software - the only way to get these buttons to appear would be to upgrade to the latest version of the onePOS software.

At the end of your troubleshooting, make sure to log out if needed (**POS > Log Out**) but **leave manager console open!**

Reminder that MC does not need to be logged in, just open.
