

Printer Active Chit

The magic of the Printer Active Chit!

The Printer Active chit is a fantastic tool that lets you know if the onePOS software can communicate with the printer. It also gives some vital information.

1. The terminal that controls the printer
2. The name of the hardware device in Management Console
3. The type of communication the printer is using
4. The port number or IP address

If you can get a "Printer Active," then you know that the onePOS system can see and communicate with the printer.

Restart the terminal that controls that printer and see if you get a "Printer Active Chit" from that printer.

- Receipt printers are usually controlled by the terminal they are connected to.
- Kitchen IP printers are usually controlled by terminal 01.
