

Settling a Credit Card Batch with Datacap Processing

Introduced in v25.2.0

Datacap processing requires an EMV reader to be physically attached to the device performing the batch settlement. Because Manager Console can be used from devices that may not have a connected EMV reader (such as a Back-of-House computer), onePOS provides a configuration option to direct the settlement request to a terminal that does have a reader attached.

Remote Settle To

A new configuration option named **Remote Settle To** is available within Payment Setup. This setting lets you choose which terminal is responsible for settling the batch.

The screenshot shows the 'Setup | Edit Payment...' window. The 'Remote Settle To' dropdown menu is open, displaying a list of terminals from 'Terminal #02' to 'Terminal #11'. The 'Terminal #02' option is selected. The window also contains various input fields for payment details, including ID, UID, Name, Sort, Logo File, EPS Type, Auto Coupon, Auto Discount, Auto Fee, Column, Row, Dol Sym, PMS ID, Minimum Amount, Max Tip Amount, Max Overpay Amount, Pre-Auth Amount, Pre-Auth Tip, Tip Fee, Exch Rate, Surchage %, Expctd Proc Rate, Manager Over, Manager Tip, Manager Tip %, Manager Overpay, Manager Cash Back, and a table for Range 1 through Range 5 with rates 0.10, 0.12, 0.15, and 0.18. The 'Last Update' is 11-24-25 09:42.

Step-by-Step: Configuring Remote Settle To

1. Open **Setup**.
2. Go to **Payments Setup**.
3. Select **Payments**.
4. Choose the desired payment method and click **Edit**.
5. Locate the **Remote Settle To** dropdown.
6. Select the terminal that has a connected EMV reader.

7. Select **OK** to save your changes.

This configuration ensures that any batch settlement started from Manager Console—on any device—will be performed by the designated terminal.

With this setup, users can start a settlement from any workstation while ensuring the transaction is completed properly through the designated terminal.
